By JAN DE VRIES After the Industrial Revolution, the mass production of products such as the railroad, the steam engine, and other technologies powered by coal, began to displace hand production methods. The empire of China changed from being primarily agricultural to a mix of agricultural and industrial areas, thus creating the conditions for an expansion in the urban population. Advances in manufacturing brought about the mechanisation of production of textiles. The invention of the steam engine allowed for the mechanisation of the cotton industry. The Industrial Revolution was characterised by the increasing productivity of work (increasing the amount of output produced in the same time-span) and by the decreasing cost of inputs required for production. In the 19th century, there was an increase in productivity because the increased use of machinery and new technologies resulted in higher output levels. As a result of the development of a national market economy in Japan, the power of landowners decreased, which led to an increase in agricultural productivity. The Industrial Revolution was characterised by an expansion of the market, and by the increasing role of the consumer as a final-demand user. Many people were forced to work in factories because of a lack of labour and land. The Industrial Revolution began in England, but spread to most countries in the world. The Industrial Revolution was an economically-driven, technologically-accelerated shift in the system of production. Increased efficiency allowed the production of greater quantities of goods, and it increased the demands of the consumers. After World War II, Japan transformed its economy from a trade-based to a manufacturing-based economy.
